ACKNOWLEDGMENTS

The quantitative measurement of fuel slosh energy dissipation rates in a spinning nutating vehicle was a pioneering effort in the field of rotating fluid dynamics. Contributors to the success of the program came from every part of the Hughes Space and Communications Group. In addition, outside contributions to the understanding of the problem came from all parts of the country. The authors would particularly like to acknowledge the efforts of the following individuals and personally thank them for their valuable contributions.

At Hughes the principal participants in the fuel slosh program were: Dr. R. K. Roney, Dr. L. Stoolman, Dr. J. W. Drebing, L. H. Grasshoff, Dr. H. A. Rosen, J. Harrison, Dr. J. Velman, G. R. Telle, F. Hummel, H. Nuttall, M. J. Neufeld, W. Turner, E. Anzivino, G. J. Adams, D. B. Krimgold, R. H. Bernard, W. Porter, G. Drinkard, J. Carlson, H. Wright, B. Page, A. J. Iorillo, R. Clapp, and Dr. R. H. Edwards (Hughes/USC).

At Comsat Labs, E. R. Martin and T. Patterson were the key personnel involved in the fuel slosh problem.

At Aerospace Corporation, W. Russell was the primary investigator.

The following consultants to Hughes and Comsat made valuable contributions: Dr. P. G. Saffman (Caltech), Dr. H. Norman Abramson (SWRI), Dr. H. Greenspan (MIT), Dr. J. V. Harrington and H. O. Curtis (Harrington, Davenport and Curtis, Inc.), Dr. P. Likins (UCLA), and Dr. H. J. Stewart (CalTech).
